

Case Study

After an increase in operations, a power station contacted our Company as they had a requirement for a new onsite welding fabrication centre.

The centre operates 24 hours per day to facilitate the maintenance and repair of complex equipment, thus the priority was for hard wearing equipment that could handle the role required.

After completing a site visit to assess the Companies needs our Design Managers proposed a simple solution.

Four welding bays were created with Welding Fume Extraction Arms with a total reach of 8 metres. This enabled long pieces to be worked on without any kind of restriction on movement in any direction.

The solutions exceeded the client's aims and the welding centre has been further expanded in line with increased operations on site.
